article_id: HC-BILL-001 product_area: billing-migration last_updated: 2026-06-01

Billing Profile Migration — Complete Implementation Guide

What Is Billing Profile Migration?

Billing profile migration moves your billing profile — payment methods, invoice history, tax information, and subscription entitlements — from the legacy billing platform to the new billing platform. Migration happens automatically for most accounts, but some accounts require the account owner to confirm the migration before it completes.

Migration runs in three stages: **queued**, **in progress**, and **completed**. You can check your current stage on the Billing Overview page under Account Settings.

Who Needs to Take Action

Most accounts migrate with no action required. You only need to take action if your account uses any of the following:

- A payment method added before 2024 that was never re-verified.
- More than one billing contact on the account.
- A custom invoice template.

If any of these apply, you will see a banner labeled "Action required before migration" on the Billing Overview page.

Migration Prerequisites

Before migration can start, the following must be true:

1. The account has at least one verified payment method.
2. There are no unresolved disputed charges on the account.
3. The account owner has accepted the updated billing terms.

If any prerequisite is not met, migration is queued indefinitely until the condition is resolved. This is the most common cause of a migration that appears "stuck" in the queued stage.

Timeline

Migration for a single account typically completes within 24 hours of all prerequisites being met. Accounts with more than 50 historical invoices may take up to 72 hours because invoice history is re-indexed during migration.

Related Articles

See "Billing Migration Error Codes and Fixes" for troubleshooting specific error codes, and "Migration Rollback and Support Escalation" if migration fails and needs to be reversed.

Account Type Compatibility Matrix

Not all account types migrate in the same way. The table below describes how the migration behaves for each account type and whether manual confirmation is required.

Account type	Auto-migrates	Confirmation required	Max migration window
Individual (personal)	Yes	No	24 hours
Team (2–25 seats)	Yes	No	24 hours
Business (26–500 seats)	Partial	Yes, by Account Owner	48 hours
Enterprise (500+ seats)	No	Yes, by Account Owner + CS rep	72 hours
Non-profit registered	Yes	No	24 hours
Government contract	No	Scheduled by billing ops	Custom window
Reseller account	No	Coordinated with partner manager	Custom window
Trial (active)	Suspended until converted	N/A	N/A
Trial (expired)	Not migrated	N/A	N/A

Enterprise and government accounts are migrated in scheduled windows to avoid disruption. If your account falls into one of these categories, a member of the billing operations team will contact you at least 14 days before your scheduled window.

Pre-Migration Checklist

Complete all items in this checklist before migration is initiated.

Incomplete items will not block migration from starting, but they will result in error codes that pause migration mid-way and require manual intervention.

Payment Method Verification

- ☐ At least one payment method is added and verified.
- ☐ If using a corporate card, the card's billing address matches the account's registered address.
- ☐ If using ACH/direct debit, a micro-deposit verification has been completed within the last 12 months.
- ☐ If using a purchase order, the PO number is valid and has not expired.
- ☐ The default payment method is explicitly set (do not rely on a single method being selected by default).

Account and Contact Information

- ☐ The account owner email is active and accessible.
- ☐ Billing contacts have been reviewed and any outdated contacts removed.
- ☐ The registered business name matches the name on the primary payment method or bank account.
- ☐ The billing address is complete (street, city, state/province, postal code, country).

Invoice and Tax Configuration

- ☐ Tax identification number (TIN/VAT/GST) is entered and validated.
- ☐ Tax exemption certificates, if applicable, are uploaded and approved.
- ☐ Custom invoice templates, if used, have been reviewed for compatibility. See the section "Custom Invoice Templates" below for the compatibility checklist.
- ☐ Invoice delivery method (email, postal, portal download) is confirmed.

Dispute and Credit Resolution

- ☐ No open billing disputes exist on the account.
- ☐ Any pending credits have been applied or acknowledged.
- ☐ Any overpayments from the previous billing cycle have been reconciled.

Subscription and Entitlement Review

- ☐ All active subscriptions are confirmed as intended (remove any accidental duplicates before migration).
- ☐ Any subscriptions on legacy pricing plans have been reviewed with a sales representative, as legacy plans may not carry over directly.
- ☐ Add-on services are confirmed as compatible with the new billing platform. See "Add-On Compatibility" in the Appendix.

Migration Process — Phase by Phase

Phase 1: Queued

When all prerequisites are met and the account is scheduled for migration, the migration record enters **queued** status. During this phase:

- No billing data has been transferred yet.
- Normal billing operations continue on the legacy platform.
- You can continue adding, removing, or updating payment methods.
- Invoices generated during this phase are created on the legacy platform and will be migrated as historical records.

The queued phase typically lasts between 1 hour and 12 hours depending on platform load. During peak migration windows (typically the first and last business days of each month), queued status may

persist for up to 24 hours.

Phase 2: In Progress

When the migration engine picks up the account record, status changes to **in progress**. This is an active state during which:

- Billing data is being read from the legacy platform and written to the new platform in a transactional sequence.
- Some operations are temporarily restricted to prevent data inconsistency. See the section "Operations Restricted During Migration" below.
- The Billing Overview page may show incomplete or stale data. This is expected. Do not interpret stale data as an error.
- Webhooks for billing events are paused. Events that occur during the in progress window will be replayed once the migration completes.
- API calls to the billing endpoints will receive a `503 Migration in Progress` response for write operations. Read operations remain available.

The in progress phase typically lasts 30 minutes to 4 hours. Accounts with very large invoice histories (500+ invoices) may take up to 8 hours.

Phase 3: Completed

When all billing data has been successfully transferred and verified, status changes to **completed**. At this point:

- All billing operations resume on the new platform.
- Invoice numbering continues from the last legacy invoice number, incremented by 1. There is no gap in invoice numbers.
- Webhooks resume and any events queued during the in progress phase are replayed in chronological order within 15 minutes.
- API calls to billing endpoints return responses from the new platform.
- A migration summary email is sent to all billing contacts.

If the migration encounters an error during the in progress phase, status reverts to **queued** with an error code attached. See the "Error Codes and Fixes" article for a complete list of codes and their remediation steps.

Operations Restricted During Migration

The following operations are not available while migration status is **in progress**. Attempting these operations will return a `503 Migration in Progress` error or a UI message asking you to try again later.

Operation	Restriction level	Reason
Add a new payment method	Blocked	Prevents write conflicts on payment profile
Remove a payment method	Blocked	Prevents data loss during transfer
Change the default payment method	Blocked	Ensures consistent transfer of default flag
Generate a manual invoice	Blocked	Invoice numbering sequence must be locked
Apply a credit or coupon	Blocked	Credits are transferred as a batch; applying mid-transfer causes duplication
Change subscription plan	Blocked	Entitlement tables are locked during transfer
Cancel a subscription	Blocked	Cancellation records must be finalized after transfer
Update billing address	Blocked	Address data is part of the transferred profile
Download a new invoice	Available	Existing invoice data is read-only during transfer

View payment history	Available	Historical reads do not affect transfer integrity
Submit a support ticket	Available	Support access is never restricted
View subscription status	Available	Status reads are safe

Data Categories That Migrate

The following data is included in the migration and will be present in full on the new billing platform after migration completes.

Payment Methods

All payment methods are migrated, including:

- Credit and debit cards (Visa, Mastercard, Amex, Discover).
- ACH/direct debit bank accounts.
- Purchase orders with valid PO numbers.
- Pre-paid balances and wallet credits.
- Promotional credits applied before migration.

Important: Payment method tokens are re-tokenized during migration. If your application stores the raw token returned by the legacy billing API, those tokens will be invalidated. Retrieve new tokens from the new billing API after migration completes. See the API migration guide for the token rotation endpoint.

Invoice History

All invoices are migrated. The original invoice number, date, line items, tax amounts, applied discounts, and payment status are preserved exactly. Invoices are migrated as read-only records; they cannot be

edited after migration because the legacy platform's approval audit trail is not migrated.

Tax Information

Tax identification numbers (TIN, VAT, GST, ABN, and equivalent) are migrated. If a tax exemption certificate was approved on the legacy platform and has not expired, it is migrated with its original approval date and expiry.

Subscription Entitlements

Active subscriptions and their associated seat counts, feature entitlements, and renewal dates migrate exactly. The renewal date does not change as a result of migration. Subscriptions that were canceled but still within a paid period also migrate and retain their end date.

Billing Contacts and Notification Preferences

All billing contact email addresses, their roles (primary, secondary, read-only), and their notification preferences (invoice emails, payment failure alerts, migration updates) migrate. If a billing contact email address has bounced more than three times on the legacy platform, that contact is marked inactive on the new platform and you will be asked to re-verify it.

Data Categories That Do Not Migrate

The following data is not included in the migration. If you rely on any of these, take manual action before or after the migration window.

Data category	Action required

Custom invoice templates from the legacy template builder	Export from legacy settings and re-upload in new platform template manager
PDF invoice attachments stored in the legacy document vault	Download from legacy portal before migration; legacy portal remains accessible for 90 days post-migration
Legacy API keys scoped to billing endpoints	Generate new API keys from the new platform's developer settings
Saved payment method nicknames	Re-enter nicknames manually on the new platform
Internal billing notes added by support agents	These are retained by the support system, not migrated to billing profile
Scheduled future invoice drafts	Re-create in the new platform's invoice scheduler
Webhook endpoint configurations	Re-register webhooks using the new platform's webhook manager

Payment Method Handling During Migration

What Happens to My Card Details?

Card details are never stored in plaintext on either platform. During migration, the card network token is exchanged through a secure tokenization gateway. The card number, expiry, and CVV are not transmitted between platforms. Only the network token — a surrogate reference — is transferred.

If the token exchange fails for a specific payment method, that payment method is marked as "needs re-verification" on the new platform. You will see a banner prompting you to re-verify the card by completing a test transaction. This does not mean your card details were lost; it means the token exchange could not be confirmed.

ACH and Bank Account Transfers

Bank account details for ACH payments are handled differently from card payments. Because ACH does not use network tokens, the routing number and last four digits of the account number are migrated as reference data. Before the migrated ACH method can be used for a new transaction, you must complete a one-time re-verification. A micro-deposit of less than $1.00 USD will be sent to the bank account within 2 business days of migration completing. Verify the amount in the Billing > Payment Methods section to activate the method.

Pre-Paid Balances

Any pre-paid balance on the legacy platform is transferred as a credit on the new platform in the same currency. The credit appears on your next invoice as "Migrated prepaid credit" and is applied before the payment method is charged. If the credit exceeds the invoice total, the remaining credit carries forward to the next billing cycle.

Invoice History Migration and Numbering

Invoice Number Continuity

Invoice numbers follow a continuous sequence. If your last legacy invoice was INV-2024-08742, your first new-platform invoice will be INV-2024-08743. There is no break in the sequence and no special prefix to indicate the platform change.

Accessing Legacy Invoices

After migration, legacy invoices are accessible in two ways:

1. **From the new platform:** The invoice list in Billing > Invoices shows all historical invoices, including pre-migration ones. Pre-migration invoices are labeled with a "Legacy" badge for the first 12 months.
2. **From the legacy portal:** The legacy portal remains available in read-only mode for 90 days after migration. You can download PDF copies of invoices during this window.

After 90 days, the legacy portal is decommissioned and legacy invoices are only accessible through the new platform.

Invoice Re-indexing for Large Accounts

Accounts with more than 50 invoices undergo invoice re-indexing during migration. Re-indexing rebuilds the search index for all historical invoices so that search and filter functions work correctly on the new platform. This process runs in the background and extends the migration window by up to 48 hours for accounts with 500+ invoices. Invoices are accessible during re-indexing; search results may be incomplete until re-indexing finishes.

Tax Information Migration

Supported Tax Identifier Types

Tax ID type	Region	Migrates automatically	Manual re-entry needed
EIN (Employer Identification Number)	United States	Yes	No
SSN (used for sole traders)	United States	Yes	No

VAT number	European Union	Yes	No
GST number	Canada	Yes	No
GST/HST number	Canada	Yes	No
ABN (Australian Business Number)	Australia	Yes	No
GSTIN	India	Yes	No
RFC	Mexico	Yes	No
CNPJ	Brazil	Yes	No
Legacy custom tax ID	All regions	No	Yes

Tax IDs stored in the "Legacy custom" field (used for tax jurisdictions that were not natively supported before 2023) are not automatically migrated. If your account uses a legacy custom tax ID, you will receive an email before migration asking you to map it to a supported identifier type.

Tax Exemption Certificates

Approved tax exemption certificates are migrated with their original approval status. However, certificates that expire within 30 days of your migration date are flagged for renewal. You will receive an email prompt to upload a renewed certificate. Billing continues to apply the exemption until the certificate expires; after expiry, standard tax rates apply until a renewed certificate is approved.

Subscription and Entitlement Migration

Plan Mapping

Subscriptions on the new platform use updated plan IDs. The table below shows the mapping from legacy plan IDs to new plan IDs. The features included in each plan do not change; only the identifier changes in the API and on invoices.

Legacy plan ID	New plan ID	Display name	Seat range
PLAN-STARTER-V1	PLAN-STARTER-2024	Starter	1–5
PLAN-TEAM-V1	PLAN-TEAM-2024	Team	6–25
PLAN-TEAM-V2	PLAN-TEAM-2024	Team	6–25
PLAN-BUSINESS-V1	PLAN-BUSINESS-2024	Business	26–200
PLAN-BUSINESS-V2	PLAN-BUSINESS-2024	Business	26–200
PLAN-ENT-V1	PLAN-ENTERPRISE-2024	Enterprise	201+
PLAN-ENT-CUSTOM	PLAN-ENTERPRISE-CUSTOM	Enterprise Custom	Negotiated
PLAN-NFP-V1	PLAN-NONPROFIT-2024	Non-Profit	1–500
PLAN-GOV-V1	PLAN-GOVERNMENT-2024	Government	Negotiated

If your legacy plan ID does not appear in this table, contact billing support before your migration window. Unmapped plans are held in "plan review" status and do not migrate until manually approved.

Seat Count and Renewal Date Preservation

The seat count and subscription renewal date are preserved exactly during migration. A subscription renewing on the 15th of each month will continue to renew on the 15th after migration. A subscription with 47 seats will have 47 seats after migration. No re-purchase or re-configuration is required.

Add-Ons and Feature Flags

Add-on services (advanced reporting, SSO, priority support, additional storage) are migrated and remain active. Feature flags set by the account owner or a support agent are migrated. Feature flags set by the billing operations team for internal testing purposes are reset to defaults during migration.

Multi-Account Organization Migration

If your account belongs to an organization with multiple child accounts, the migration of each account is coordinated but sequential. The organization's billing settings (consolidated invoicing, spending limits, approval workflows) are migrated as a unit when the primary account (the account that pays the consolidated invoice) completes migration.

Migration Order Within an Organization

1. The primary (billing) account migrates first.
2. Child accounts are queued for migration in alphabetical order by account name.
3. Each child account migrates independently; a failure on one child does not block others.
4. Consolidated invoicing resumes once all child accounts have completed migration. During the period when some child accounts are migrated and some are not, invoices are generated separately per platform.

Cross-Account Credits and Spending Limits

Cross-account credits (where a credit on the primary account is applied to child account invoices) are suspended during the migration window. Any credit that would have been applied during the suspension period is added as a carryover credit on the primary account's next invoice.

Spending limits set at the organization level are preserved. Spending limits set at the individual child account level may need to be re-confirmed after migration because they are validated against the new platform's entitlement service.

Single Sign-On and Identity Impact

Billing migration does not affect your SSO configuration. The identity provider (IdP) connection, attribute mapping, and SCIM provisioning settings live in a separate identity management system that is not part of the billing platform. However, if your SSO setup includes role-based billing access (for example, members of an "FinanceTeam" group automatically receive the Finance Viewer billing role), those role assignments are preserved because billing roles are stored against the user record in the identity system, not in the billing profile.

The one exception is custom billing roles created using the legacy role builder. These custom roles are not migrated automatically. See the "Role and Permission Migration" section of this article.

API and Webhook Changes After Migration

Endpoint Changes

The new billing platform exposes a different API base URL. After

migration, update your integrations to use the new base URL. Both URLs remain active for a 90-day transition period, after which the legacy endpoint is retired.

Environment	Legacy base URL	New base URL
Production	api.billing-legacy.example.com/v1	api.billing.example.com/v2
Staging	api.billing-legacy-staging.example.com/v1	api.billing-staging.example.com/v2
Sandbox	api.billing-sandbox-legacy.example.com/v1	api.billing-sandbox.example.com/v2

Breaking Changes in the New API

Legacy endpoint	Change type	New behavior
GET /invoices	Response schema updated	`invoice_number` field renamed to `number`; `created_at` now ISO 8601 with timezone
POST /payment-methods	Tokenization changed	Returns `token_v2` instead of `token`; `token` field included for 90-day backward compatibility
GET /subscriptions	Plan ID format changed	Returns new plan IDs; legacy plan IDs available in `legacy_plan_id` field for 90 days
POST /credits	New required field	Requires `reason_code` field; accepted values: ADJUSTMENT, REFUND, PROMOTIONAL
DELETE /payment-methods/:id	Behavior change	Returns 409 if method is the only verified payment method (legacy returned 200 and silently failed)

Webhook Event Changes

Webhooks are paused during the in progress phase and replayed after migration completes. The replay order is chronological by event timestamp. If your webhook handler is not idempotent, duplicate events may cause issues because the replay can re-fire events that were successfully delivered before migration began. Review your webhook handler's idempotency before the migration window.

New events available on the new platform that do not exist on the legacy platform:

Event name	Fired when
billing.migration.completed	Account migration finishes successfully
billing.migration.failed	Migration encountered an unrecoverable error
billing.token.rotated	A payment method token was re-tokenized during migration
billing.credit.migrated	A pre-paid balance was transferred as a migrated credit

---

Custom Invoice Templates

Custom invoice templates from the legacy template builder are not automatically migrated. The new platform uses a different template engine (Liquid-based) that is not backward compatible with the legacy engine (Mustache-based).

Compatibility Checklist for Custom Templates

Before migration, review your custom template against this compatibility list:

Legacy template feature	Compatible with new platform	Action
Company logo (PNG/SVG)	Yes	Automatically available
Custom header text	Yes	Carried over from legacy
Custom footer text	Yes	Carried over from legacy
Mustache-style variable substitution (`{{{variable}}}`)	No	Must rewrite in Liquid syntax (`{{ variable }}`)
Conditional blocks (`{{#if}}`)	No	Must rewrite as Liquid conditionals (`{% if %}`)
Custom CSS in template	Partially	Inline styles only; external stylesheets not supported
Multi-language templates	Yes	Language selection logic must be rewritten in Liquid
QR code in footer	No	QR code generation is a new platform feature configured separately

Re-creating a Template After Migration

After migration completes, go to Billing > Settings > Invoice Templates. The new template editor provides:

- A WYSIWYG editor for non-technical users.
- A raw Liquid template editor for developers.
- A library of 12 pre-built templates that match common layouts.
- A template import tool that attempts to convert Mustache syntax to

Liquid. The import conversion is best-effort and may require manual correction.

Billing Contacts and Notification Settings

Contact Roles

Each billing contact on the account can be assigned one of the following roles. Roles control what actions a contact can take and which notifications they receive.

Role	Can view invoices	Can pay invoices	Can change payment methods	Can change billing settings	Receives all billing emails
Account Owner	Yes	Yes	Yes	Yes	Yes
Billing Administrator	Yes	Yes	Yes	Yes	Yes
Finance Viewer	Yes	No	No	No	Invoice emails only
Payment Approver	Yes	Yes	No	No	Payment-related only
Auditor (read-only)	Yes	No	No	No	No

Notification Categories

Category	Default state	How to adjust

Invoice generated	On	Billing > Notifications
Payment successful	On	Billing > Notifications
Payment failed	On, cannot be turned off for Account Owner	Billing > Notifications
Migration status updates	On during migration window, auto-disabled after	Billing > Notifications
Subscription renewal reminder	On (14 days before)	Billing > Notifications
Spending limit alert	Off by default	Billing > Spending Limits
Dispute opened/ resolved	On	Billing > Notifications

Credit Balance Handling

Types of Credits

The new billing platform distinguishes between four types of credit:

Credit type	Source	Expiry	Refundable
Promotional	Issued by sales or marketing	As specified (usually 90 days)	No
Adjustment	Issued by support for billing errors	12 months	No
Migrated prepaid	Transferred pre-paid balance from legacy	None	On request

Refund credit	Issued instead of a payment reversal	24 months	Yes, if unused

Credit Application Order

When an invoice is generated, credits are applied in this order:

1. Refund credits (oldest first).
2. Migrated prepaid credits.
3. Adjustment credits (oldest first).
4. Promotional credits (earliest expiry first).

This order ensures that credits with the earliest expiry are used first to prevent unexpected expiration.

Recurring Billing and Auto-Pay Impact

Auto-pay is paused automatically during migration and does not resume until the account owner confirms the new default payment method. If a billing cycle falls during the migration window, the invoice is generated but payment is deferred. Once migration completes and auto-pay resumes, any deferred invoices are paid immediately using the default payment method. If the deferred period spans more than one billing cycle, each deferred invoice is paid separately in chronological order.

A grace period of 7 days applies during the migration window. Late payment fees are not charged for invoices that become due during the in progress phase, provided payment is made within 7 days of migration completing.

Trial and Promotional Pricing Impact

Active Trial Accounts

Trial accounts cannot be migrated until the trial is converted to a paid subscription. Migration for a trial account is queued but will not proceed to in progress until the trial conversion is complete.

Promotional Pricing

If an account has a promotional price applied to a subscription (for example, a 20% discount for the first 12 months), that promotional price is preserved through migration. The promotional period does not reset; if 4 months of a 12-month promotion have elapsed, 8 months remain after migration.

Legacy Grandfathered Pricing

Accounts on grandfathered legacy pricing plans (plans that were discontinued after 2022 but kept for existing subscribers) will see their pricing preserved through migration. The plan features will be mapped to the equivalent new platform entitlements. If a grandfathered plan has no direct equivalent on the new platform, a billing operations specialist will contact the account owner to discuss options at least 30 days before the migration window.

Migration Status Notifications

Email Notifications Sent Automatically

Notification	Sent when	Recipients
Migration scheduled	7 days before window	Account Owner, Billing Administrator

Migration starting	1 hour before in progress	Account Owner, Billing Administrator
Migration completed	Immediately after completion	All billing contacts
Migration failed	Immediately after failure	Account Owner, Billing Administrator
Action required	When a blocking condition is detected	Account Owner
Re-verification required	When a payment method needs re-verification	Account Owner, Billing Administrator

In-App Banners

During the migration window, banners appear in the Billing Overview page:

- **Blue banner:** Migration is queued or in progress.
- **Green banner:** Migration completed successfully.
- **Red banner:** Migration failed. Includes the error code and a link to the remediation article.
- **Yellow banner:** Action required to unblock migration.

Audit Log and Compliance Records

All migration events are written to the account's audit log with a `billing.migration.*` event type. The audit log is available under Account Settings > Audit Log. Audit log records cannot be deleted and are retained for 7 years in accordance with financial record-keeping requirements.

Audit Log Event Types for Migration

Event type	Description
billing.migration.scheduled	Migration window assigned to account
billing.migration.prerequisites_check	Automated prerequisite validation run
billing.migration.started	In progress phase began
billing.migration.data_transfer_completed	All data successfully copied to new platform
billing.migration.verification_passed	Post-transfer data integrity check passed
billing.migration.completed	Migration finalized; account now on new platform
billing.migration.failed	Error encountered; status reverted to queued
billing.migration.rollback_requested	Rollback request submitted
billing.migration.rollback_completed	Rollback to legacy platform completed

---

Post-Migration Verification Checklist

After migration completes, verify the following before treating migration as done:

Immediate Checks (within 1 hour)

- ☐ Invoice list shows all historical invoices, including pre-migration ones.
- ☐ The default payment method is correct.
- ☐ Subscription plan and seat count are correct.

- ☐ Billing contacts are all present and have correct roles.
- ☐ Tax ID is displayed correctly.
- ☐ Outstanding invoice balance (if any) matches expectations.

Next Billing Cycle

- ☐ Auto-pay successfully charged the default payment method.
- ☐ Invoice generated with the correct subscription line items.
- ☐ Invoice number follows the expected sequence.
- ☐ Tax was calculated correctly.
- ☐ Any promotional or adjustment credits were applied in the correct order.

API and Integrations (within 24 hours)

- ☐ API integration updated to use new base URL.
- ☐ New payment method tokens retrieved and stored.
- ☐ Webhook endpoint re-registered if not done before migration.
- ☐ Webhook handler confirmed receiving migration replay events.
- ☐ Reporting integration pulling data from new platform.

Known Limitations of This Migration

The following limitations apply to this migration. Where a workaround exists, it is noted.

Limitation	Impact	Workaround
Legacy custom tax IDs not migrated automatically	Tax may be calculated without exemption if not remediated	Map to a supported tax ID type before migration

Custom invoice templates require rewrite	Invoices revert to default template until new template is created	Create new template using provided Liquid template library
Payment method nicknames not migrated	Users must re-add nicknames	Use Bulk Nickname Import tool in Payment Methods settings
Webhook endpoints not migrated	Webhooks silently dropped until re-registered	Re-register before migration using new platform's webhook manager
Legacy API keys invalidated	Integrations break immediately on migration completion	Generate new keys from Developer Settings before migration
Invoice draft scheduler reset	Any drafts created in the legacy scheduler are lost	Export draft list from legacy and re-create in new scheduler
Custom roles from legacy role builder not migrated	Users with custom roles revert to Finance Viewer	Re-create roles in new Role Management settings within 30 days

Frequently Asked Questions

Will migration affect my current subscription or pricing? No. Subscription terms, pricing, seat counts, and renewal dates are preserved exactly. Migration is a platform transfer, not a contract change.

Do I need to re-enter my payment information? Most payment methods are migrated automatically. You may be asked to re-verify a payment method if the token exchange cannot be confirmed during migration. A re-verification prompt will appear on the Billing Overview page.

Will my invoice number reset after migration? No. Invoice numbers continue from where the legacy platform left off. If your last legacy invoice was INV-2024-08742, your next invoice will be INV-2024-08743.

What happens if I receive an invoice during the migration window? Invoices generated during the in progress phase are deferred. Payment is collected automatically within 24 hours of migration completing. A 7-day grace period applies; late fees are not charged during this window.

Can I opt out of migration? No. Migration to the new billing platform is mandatory for all accounts. However, the timing of your migration window can be adjusted in limited circumstances. Contact billing support at least 14 days before your scheduled window to request a reschedule.

What happens to my tax exemption certificates? Approved certificates are migrated. If a certificate expires within 30 days of your migration date, you will receive a renewal prompt. Billing continues to apply the exemption until the certificate expires.

How do I know when migration is complete? You will receive an email to all billing contacts when migration completes. A green confirmation banner also appears on the Billing Overview page.

Can migration be reversed after it completes? No. Once migration reaches completed status, it cannot be rolled back. Invoice numbering and tax records have already switched to the new platform's format, and reversing them would create compliance issues.

Why does my Billing Overview page show incomplete data during migration? The Billing Overview page reads from the new platform as soon as migration starts. While data is still being transferred, some fields may show as empty or stale. This is expected. The page returns to normal once migration completes.

Are there any downtime windows during migration? No planned downtime. Write operations to billing endpoints are blocked during the in progress phase (returning 503 responses), but the platform remains accessible and all read operations are available.

What if I update my payment method right before migration starts? Updates made less than 1 hour before the in progress phase may not be

captured before the profile snapshot is taken. If you need to update a payment method, do so at least 2 hours before your scheduled migration window.

How do multi-account organizations handle a failure in one child account? A failure in one child account does not block other child accounts or the primary account from completing migration. The failed child account retries independently once the error is resolved.

Will my API keys stop working immediately after migration? Legacy API keys continue to work against the legacy API endpoint for 90 days after migration. After 90 days, the legacy endpoint is retired and only new API keys on the new endpoint will work.

Can I generate a new invoice manually during migration? No. Manual invoice generation is blocked during the in progress phase. Once migration completes, you can generate invoices normally.

Does migration affect my SSO login? No. SSO configuration is managed by the identity platform, which is separate from billing. Login is not affected.

What is the difference between a queued and a stuck migration? Queued is the normal waiting state before migration begins. Stuck is an informal term for a migration that has been in queued status for longer than expected — usually because a prerequisite is not met. If your migration has been queued for more than 24 hours, check the Billing Overview page for a yellow "Action required" banner.

Do I need to do anything for my recurring billing after migration? Auto-pay resumes automatically after migration. No action is required unless the account owner is prompted to confirm the default payment method.

Will I lose my promotional discount after migration? No. Promotional pricing, including grandfathered legacy pricing, is preserved through migration.

How are invoice PDFs handled after the legacy portal is decommissioned? All invoice PDFs, including those generated on the legacy platform, are accessible from the new platform's invoice list. The

legacy portal remains available for 90 days as a backup access method.

What should I do if I see a billing discrepancy after migration?
Submit a billing dispute from Billing > Invoices > [Invoice] > Dispute. Include the invoice number and a description of the discrepancy. The billing support team will investigate and respond within 5 business days.

Glossary

Account Owner: The user with the highest privilege level on a billing account. Responsible for confirming migration and is the primary recipient of billing notifications.

ACH: Automated Clearing House. A US-based electronic bank transfer network used for direct debit payment methods.

Billing Administrator: A secondary role with full billing access. Can perform all billing operations except modify the Account Owner role.

Billing Contact: Any user with a billing role on the account who receives billing notifications.

Chargeback: A payment reversal initiated by the card issuer at the cardholder's request. Opens a dispute on the billing account.

Credit: A positive balance applied to an account that reduces the amount charged on the next invoice.

Entitlement: A feature or resource limit granted by a subscription plan.

Finance Viewer: A read-only billing role. Can view invoices and payment history but cannot make changes.

Grandfathered Plan: A subscription plan that is no longer offered to new customers but is retained for existing subscribers who subscribed before the plan was discontinued.

Invoice: A document requesting payment for services rendered,

generated at the end of each billing cycle.

Legacy Platform: The previous billing infrastructure that accounts are migrating away from.

Migration Window: The scheduled time period during which an account's billing data is transferred from the legacy platform to the new platform.

New Platform: The current billing infrastructure that all accounts are migrating to.

Plan ID: A unique identifier for a subscription plan. Changes from legacy format to new format during migration.

PO (Purchase Order): A payment method used by businesses to pay invoices against an approved purchase order number.

SSO (Single Sign-On): A method of authentication that allows users to log in with a single set of credentials managed by an external identity provider.

Token: A surrogate reference that represents a payment method without storing the actual card or bank details.

TIN (Tax Identification Number): A number assigned by a tax authority to identify a taxpayer.

Webhook: An HTTP callback sent from the billing platform to a registered endpoint when a billing event occurs.

Appendix A: Platform Comparison

Feature	Legacy platform	New platform
API version	v1	v2

Webhook delivery guarantee	At least once	Exactly once (with idempotency key)
Invoice template engine	Mustache	Liquid
Token format	32-char alphanumeric	UUID v4
Tax engine	Rule-based (manual maintenance)	API-driven (auto-updated for new jurisdictions)
Audit log retention	3 years	7 years
Credit types	2 (promotional, adjustment)	4 (promotional, adjustment, migrated prepaid, refund)
SSO integration	SAML 2.0 only	SAML 2.0 + OIDC
Spending limits	Account-level only	Account-level and organization-level
Multi-currency invoicing	USD only	25+ currencies
Invoice PDF generation	Synchronous	Asynchronous (webhook notification on ready)
Sandbox environment	Shared	Dedicated per account

Appendix B: Migration Timeline by Account Size

Account size (invoices)	Queued phase	In progress phase	Total max window
0–10 invoices	1–6 hours	30 minutes	7 hours

11–50 invoices	1–12 hours	30–60 minutes	13 hours
51–200 invoices	1–12 hours	1–4 hours	16 hours
201–500 invoices	1–24 hours	4–8 hours	32 hours
501–2000 invoices	12–24 hours	8–24 hours	48 hours
2001+ invoices	Scheduled window	24–72 hours	Coordinated with billing ops

---

Troubleshooting Guide — Migration Phase by Phase

This section walks through the most common problems encountered at each phase of migration and provides step-by-step resolution instructions.

Troubleshooting: Migration Stuck in Queued Status

A migration that has been in queued status for more than 24 hours is considered stuck. The most common causes and resolutions are described below.

Cause 1: Unresolved prerequisite

Check the Billing Overview page for a yellow "Action required" banner. The banner will state which prerequisite is unresolved. Common unresolved prerequisites include an expired payment method, an open billing dispute, or an unsigned updated billing terms agreement.

Resolution steps:

1. Navigate to Billing > Overview.

2. Read the "Action required" banner carefully.
3. Follow the link in the banner to the affected section.
4. Complete the required action.
5. Return to Billing > Overview and click "Resume migration."

Cause 2: Prerequisite check ran before the action was saved

If you completed an action (for example, added a new payment method) but migration is still showing as stuck, the prerequisite check may have run before your change was saved to the database. The check runs every 4 hours.

Resolution steps:

1. Confirm the action was saved by navigating to the relevant settings page and verifying the change appears.
2. Wait up to 4 hours for the next automatic prerequisite check.
3. Alternatively, trigger a manual prerequisite check from Billing > Overview by clicking "Check prerequisites now."

Cause 3: Account belongs to an organization whose primary account is stuck

If your account is a child account in a multi-account organization, migration of child accounts is blocked until the primary account completes migration.

Resolution steps:

1. Identify the primary account for your organization from Account Settings > Organization.
2. Contact the account owner of the primary account and ask them to check their migration status.
3. Once the primary account completes migration, your account's migration will resume automatically within 2 hours.

Cause 4: Platform migration queue is at capacity

During peak migration periods (first and last business days of each month), the migration queue may be at capacity. Accounts are processed in the order they entered the queue.

Resolution steps:

1. Check the platform status page for any posted migration queue delays.
2. No action required; migration will proceed automatically as capacity becomes available.

Troubleshooting: Migration Failed During In Progress Phase

If migration fails during the in progress phase, the status reverts to queued and an error code is attached. The migration engine has already rolled back any partial writes to the new platform — no data has been lost.

General resolution steps:

1. Note the error code displayed on the Billing Overview page.
2. Look up the error code in the "Billing Migration Error Codes and Fixes" article.
3. Apply the fix described for that error code.
4. Return to Billing > Overview and click "Resume migration."
5. Monitor the migration status for 30–60 minutes to confirm it transitions to "in progress" and then to "completed."

If the error code is not in the article:

Internal diagnostic codes (not documented in the error code article) indicate infrastructure-level problems that cannot be resolved by account administrators. Submit a support ticket from Help > Contact Support > Billing Migration Issue. The support team will investigate and respond within 4 business hours.

If migration fails on the same step three times in a row:

This indicates a persistent data problem that retries will not fix. Stop retrying and escalate immediately. Continued retries on a persistently failing migration can complicate the support team's ability to diagnose the issue because each retry generates a new event log entry.

Troubleshooting: Billing Overview Shows Incorrect Data After Migration

If the Billing Overview page shows incorrect or stale data after migration completes (for example, wrong subscription plan, missing invoices, or a zero balance when a credit is expected), follow these steps:

1. **Clear your browser cache.** The Billing Overview page caches some data client-side for performance. A hard refresh (Ctrl+Shift+R or Cmd+Shift+R) forces the page to re-fetch from the server.

2. **Wait 15 minutes.** Some data (particularly migrated pre-paid credits and subscription entitlements) is written asynchronously after the main migration completes. The Billing Overview page may not reflect these items immediately.

3. **Check the migration completion email.** The email sent to billing contacts on migration completion includes a summary of what was migrated. If the email summary matches the page, the data is correct and the display issue is a browser cache problem.

4. **Check the audit log.** Navigate to Account Settings > Audit Log and filter by "billing.migration.*" events. The log will show exactly what data was transferred and when.

5. **Submit a support ticket if the issue persists.** If the page is still showing incorrect data 2 hours after migration completed, submit a support ticket. Include a screenshot of the incorrect data and the migration ID from the audit log.

Troubleshooting: Payment Method Marked as Needs Re-Verification After Migration

If one or more payment methods are marked as "Needs re-verification" after migration, this means the token exchange for that payment method

could not be confirmed during migration. The payment method is retained on the account but is not active until re-verification is complete.

For credit and debit cards:

1. Navigate to Billing > Payment Methods.
2. Find the card marked as "Needs re-verification."
3. Click "Verify now."
4. Complete the verification by entering the card's CVV. A test authorization of $0.00 to $1.00 is placed and immediately released.
5. If the verification succeeds, the card becomes the active payment method.
6. If the verification fails, the card issuer has declined the verification. Add a new card or use an alternative payment method.

For ACH bank accounts:

1. Navigate to Billing > Payment Methods.
2. Find the bank account marked as "Needs re-verification."
3. Click "Verify with micro-deposit."
4. A micro-deposit of two amounts, each less than $1.00 USD, will be sent to the bank account within 2 business days.
5. Once the deposits appear on your bank statement, enter the amounts in Billing > Payment Methods > [Bank Account] > Enter deposit amounts.
6. If the amounts match, the bank account is verified and active.

Troubleshooting: Webhooks Not Firing After Migration

If your webhook endpoints are not receiving events after migration completes, the most likely causes are:

Cause 1: Webhook endpoints were not re-registered on the new platform

Webhook configurations are not migrated automatically. You must re-register your webhook endpoints on the new platform.

Resolution:

1. Navigate to Developer Settings > Webhooks.
2. Click "Add endpoint."
3. Enter the endpoint URL and select the event types you want to receive.
4. Save the endpoint.
5. Test the endpoint by clicking "Send test event."

Cause 2: Replayed events from migration were rejected by your handler

During migration, the new platform replays any billing events that occurred while webhooks were paused. If your handler rejected these replayed events (for example, because they appeared to be duplicates), you may be missing updates.

Resolution:

1. Review the webhook delivery log in Developer Settings > Webhooks > [Endpoint]

   > Delivery log.

2. For any events showing a non-2xx response, re-process them manually or trigger a re-delivery from the delivery log.
3. Update your webhook handler to be idempotent. Check the `idempotency_key` field in the event payload and skip processing if you have already handled that key.

Cause 3: Event types changed on the new platform

Some event types have been renamed or replaced on the new platform. If you are subscribing to a deprecated event type, you will not receive events.

Resolution:

1. Review the webhook event change log in the API changelog.
2. Update your subscription to use the new event type names.

Regional Compliance and Data Residency

Data Residency Options

Billing data is stored in the region closest to your account's registered address by default. Enterprise and Government accounts can request a specific data residency region.

Region	Data center locations	Available to
United States	Virginia, Oregon	All account types
European Union	Frankfurt, Amsterdam	All account types
United Kingdom	London	All account types
Australia	Sydney	All account types
Canada	Toronto, Montreal	All account types
Japan	Tokyo	Enterprise and Government only
Singapore	Singapore	Enterprise and Government only
Brazil	São Paulo	Enterprise and Government only

Data residency selection is made during account creation or can be requested by submitting a Data Residency Change Request through billing support. Changes to data residency require a full re-migration of billing data and are typically completed within 14 business days.

Compliance Certifications

The new billing platform has been certified for the following compliance

frameworks:

Framework	Scope	Certificate available
SOC 2 Type II	Security, availability, confidentiality	Yes, on request
ISO 27001	Information security management	Yes, on request
PCI DSS Level 1	Payment card data handling	Yes, on request
GDPR	EU personal data processing	Data Processing Agreement available
HIPAA	Health information (if applicable)	BAA available for qualifying accounts
FedRAMP Moderate	US government cloud services	In progress (expected Q4 2026)
CCPA	California consumer privacy	Privacy Notice available

GDPR-Specific Behavior During Migration

During migration, billing data for EU accounts is processed within the EU data center and is not transferred to non-EU data centers at any point. The migration engine that processes EU accounts runs entirely within the EU region.

If you require a Data Processing Agreement (DPA) for the migration, contact your account manager before the migration window. A DPA can be signed and attached to your account before migration begins.

Right to Erasure and Migration

The right to erasure (GDPR Article 17) does not apply to billing records because they are required for tax and financial compliance purposes under GDPR Article 17(3)(b). Billing records are retained for 7 years

after the end of the relevant tax year.

Security During Migration

Encryption in Transit

All data transferred between the legacy platform and the new platform during migration is encrypted using TLS 1.3. The migration engine does not decrypt and re-encrypt data at rest — it transfers data between encrypted storage layers using a secure key exchange protocol managed by the platform security team.

Encryption at Rest

Billing data on both platforms is encrypted at rest using AES-256. Payment method tokens are encrypted using the card network's encryption keys and are never stored in plaintext on either platform.

Access Control During Migration

During the in progress phase, write access to billing data is restricted to the migration engine service account. Human administrators — including billing support agents and platform engineers — do not have direct write access to billing data during the migration. All reads by support agents are logged.

Security Event Logging During Migration

In addition to the billing audit log, all access to billing data during migration is logged in the platform security event log. Security event logs are separate from the billing audit log and are available to the account owner on request by submitting a Security Log Access Request through

support.

Change Management Recommendations

For organizations with multiple stakeholders affected by billing migration, the following change management steps are recommended to minimize disruption.

14 Days Before Migration

Task	Owner	Notes
Communicate migration date to finance team	Account Owner	Include expected window and any disruptions
Review API integrations for breaking changes	Engineering lead	See API Changes section
Re-register webhook endpoints on new platform	Engineering lead	Can be done before migration; events will not fire until migration completes
Complete the Pre-Migration Checklist	Billing Administrator	Available in the main migration guide
Brief accounts payable team	Finance lead	Explain invoice deferral during migration window

7 Days Before Migration

Task	Owner	Notes

Generate new API keys on new platform	Engineering lead	Legacy keys still work for 90 days; start transitioning now
Update integration configurations to use new base URL	Engineering lead	Use dual-write for 90 days if needed
Confirm all billing contacts have valid email addresses	Billing Administrator	Bounced contacts will not receive migration notifications
Download any invoice PDFs needed immediately	Finance lead	Legacy portal decommissioned 90 days post-migration
Brief customer success team	Account Owner	Inform them of any expected billing disruptions during window

Day of Migration

Task	Owner	Notes
Monitor migration status	Billing Administrator	Check Billing Overview every hour during in progress phase
Pause any scheduled billing-related batch jobs	Engineering lead	Batch jobs calling the billing API will receive 503 responses
Notify finance team when in progress phase begins	Account Owner	A brief heads-up prevents confusion if reports show stale data

After Migration Completes

Task	Owner	Notes

Complete Post-Migration Verification Checklist	Billing Administrator	See the checklist section in this article
Test a billing API call on the new base URL	Engineering lead	Confirm the integration is routing to the new platform
Confirm webhook events are flowing	Engineering lead	Check delivery log in Developer Settings
Notify finance team that billing is restored	Account Owner	
Re-create custom invoice templates if needed	Finance lead	See Custom Invoice Templates section
Re-enter payment method nicknames	Billing Administrator	Nicknames are not migrated

Extended FAQ — Additional Questions

What if I miss my migration window? If you do not complete any required actions before your migration window, the window is extended automatically. Migration will not proceed to the in progress phase until all blocking prerequisites are met. There is no penalty for missing the original window.

Can I have two active subscriptions after migration? Yes. Migration does not change the number of active subscriptions on the account. If you had two active subscriptions before migration, you will have two after.

What happens to my billing address if I have multiple addresses on file? The default billing address is migrated and remains the default. All additional addresses are also migrated. The default address selection does not change.

How are refunds handled during migration? Pending refunds initiated before migration are processed on the legacy platform before the migration window begins. Refunds requested during the migration window are queued and processed on the new platform after migration completes.

Is there a way to test migration in a staging environment? Yes. If your account has a linked staging or sandbox environment, a test migration is automatically run against the staging environment 48 hours before the production migration window. The test migration uses production data snapshots to validate the migration process. Results of the test migration are emailed to billing contacts.

Will my usage data and analytics reset after migration? No. Usage data and analytics are stored in a separate analytics system that is not part of the billing profile migration. Your usage history is unaffected.

Can I change the account owner before migration? Yes, but it is strongly recommended to complete the account owner change at least 72 hours before the migration window to ensure the new owner's email is verified and the change is reflected in the billing profile before migration is scheduled.

What if I discover a discrepancy in my invoice history after migration? Submit a billing dispute from Billing > Invoices > [Invoice] > Dispute. The billing support team will compare the new platform's records with the legacy platform's records (the legacy platform remains in read-only mode for 90 days after migration) and resolve any discrepancy.

Do I need to update my accounts payable system after migration? If your accounts payable system stores the billing platform's API base URL or invoice portal URL, update these references after migration. Invoice numbers and amounts will not change, so existing records in your AP system remain accurate.

What is the migration engine? The migration engine is the internal service that reads billing data from the legacy platform and writes it to the new platform. It runs as a managed service inside the billing platform infrastructure and is not directly accessible to account administrators or support agents.

How many accounts are migrated simultaneously? The migration engine runs up to 500 accounts in parallel during a migration window. Accounts are batched by size to prevent large accounts from blocking the queue. Enterprise and Government accounts are migrated in dedicated batches outside of the shared migration window.

Can I pause migration once it has started? Migration cannot be paused once the in progress phase has begun. If you need to stop migration, wait until it either completes or fails. If it fails, it automatically reverts to queued status and no further action is taken until you retry.

What if my company name changes during the migration window? If your registered business name changes during the migration window, wait until migration completes before updating the name. Updating account details during the in progress phase may cause a data consistency error.

Are there any file size limits on tax exemption certificates? Yes. The new platform accepts PDF files up to 10 MB. Files larger than 10 MB must be compressed or split before uploading.

What credit card networks are supported on the new platform? Visa, Mastercard, American Express, Discover, Diners Club, UnionPay, and JCB are all supported. The legacy platform did not support UnionPay or JCB; if your account has a UnionPay or JCB card on file, it will be migrated and will become active on the new platform for the first time.

Can I use the legacy platform to generate reports after migration? The legacy platform is in read-only mode for 90 days after migration. You can view and export data from the legacy platform's reporting module during this period. After 90 days, the legacy platform is decommissioned and reporting is only available from the new platform.

What happens to scheduled subscription renewals that fall during the migration window? Subscription renewals that fall during the in progress phase are deferred and processed automatically on the new platform within 4 hours of migration completing. You will receive a renewal invoice shortly after migration completes if a renewal was deferred.

Can billing contacts receive migration status updates via SMS? SMS notifications for migration status are not currently available. Email is the only notification channel for migration status updates. In-app banners on the Billing Overview page also display real-time status.

What should I do if a billing contact's email address changed just before migration? Update the email address in Billing > Contacts at least 24 hours before the migration window. Email changes take up to 24 hours to propagate. If the migration window starts before the update propagates, the old address will receive migration notifications.

Are there any differences in invoice formatting between the legacy and new platforms? The default invoice layout is updated on the new platform. The key changes are: company logo placement has moved from the top right to the top left; the invoice due date is now displayed more prominently; line item descriptions support up to 500 characters (up from 255 on the legacy platform); and a QR code linking to the online payment portal is included by default.

Can I use a different currency for different subscriptions after migration? Yes. The new platform supports per-subscription currency assignment for Business and Enterprise accounts. Contact billing support to configure multi-currency subscriptions after migration.

What is the maximum number of payment methods I can have on my account? The new platform supports up to 25 payment methods per account (up from 10 on the legacy platform). All payment methods from the legacy platform will be migrated regardless of this limit; the limit applies only to methods added after migration.

Will the migration affect my NetSuite or QuickBooks integration? If you use an accounting integration (NetSuite, QuickBooks, Xero, or similar), the integration will need to be re-authenticated after migration because the billing account ID format changes. You may also see a SYNC-9001 or SYNC-9002 error code. See the integration-specific reconnection guide in Billing > Integrations > [Integration name] > Reconnect.

Appendix C: Migration Error Code Quick Reference

Code	Series	Blocking	One-line description
ERR-4032	Core	Yes	Required field missing from profile
ERR-4040	Core	Yes	Payment method re-verification failed
ERR-4155	Core	Yes	Duplicate billing profile
ERR-5010	Core	No	Invoice account locked (dispute)
ERR-5020	Core	No	Tax ID in unsupported legacy format
PAY-1001	Payment	Yes	Default card expired
PAY-1002	Payment	Yes	Issuer declined verification charge
PAY-1003	Payment	Yes	Invalid ACH routing number
PAY-1004	Payment	Yes	ACH micro-deposit expired
PAY-1007	Payment	Yes	Tokenization timeout
INV-2001	Invoice	Yes	Invoice record inconsistent
INV-2003	Invoice	Yes	Overdue unpaid invoice
INV-2006	Invoice	Yes	Child accounts not yet migrated
TAX-3001	Tax	No	Tax ID could not be verified
TAX-3004	Tax	Yes	Tax ID conflict
SUB-4001	Subscription	Yes	Legacy plan has no mapping
SUB-4002	Subscription	Yes	Subscription in payment-failed state

ACC-5001	Account	Yes	Owner email not verified
ACC-5003	Account	No	Too many billing contacts
ACC-5006	Account	Yes	Account under legal hold
DAT-6001	Data	Yes	Checksum mismatch
DAT-6005	Data	Yes	Referential integrity violation
NET-7001	Network	No	Legacy API timeout
NET-7002	Network	No	New platform API timeout
ROLE-8001	Role	No	Custom role cannot be mapped
ROLE-8003	Role	Yes	No Account Owner assigned
SYNC-9001	Sync	No	Accounting connector lost auth

Appendix D: Support Escalation Contacts

Issue type	Contact	Expected response time
Blocking error after two retries	Billing support via Help > Contact Support	4 business hours
Data integrity error (DAT-series)	Billing support — Priority queue	2 business hours
Legal hold blocking migration	Account manager	1 business day
Trust and safety flag	Trust and safety team via support portal	2 business days
Enterprise migration scheduling	Dedicated billing operations specialist	Confirmed via email

Government migration coordination	Partner billing operations	Confirmed via contract
Security log access request	Security team via support portal	5 business days
