Migration Rollback and Support Escalation

When a Rollback Is Possible

A billing profile migration can be rolled back to the legacy platform only if the migration has not yet reached the **completed** stage. Once a migration reaches completed status, it cannot be rolled back, because invoice numbering and tax records have already switched to the new platform's format.

Rollback-Related Error Codes

Error code	Cause	Fix
ERR-6001	Rollback was requested after the migration already reached completed status	Rollback is not available; contact billing support for a manual correction instead
ERR-6015	Rollback failed because the legacy billing profile was already archived	Contact billing support to restore the archived legacy profile before retrying rollback
ERR-6030	Rollback was requested by a user without the Billing Administrator role	Ask an Account Owner or Billing Administrator to submit the rollback request

How to Request a Rollback

1. Go to the Billing Overview page.
2. Select "Request rollback" under Migration Status.
3. Provide a reason for the rollback request.

Rollback requests are processed within 4 business hours while migration is still in the queued or in-progress stage.

Escalating to Support

Escalate to billing support when:

- The same migration error code recurs after two retry attempts.
- A rollback request fails with ERR-6015.
- Migration has been stuck in the queued stage for more than 72 hours.

When escalating, include the account ID, the exact error code, and the migration stage shown on the Billing Overview page. Support cannot look up your account without the account ID.

Support Response Time

Escalated migration issues receive a first response within one business day. This article does not define a guaranteed resolution time or compensation for migration delays; no such commitment exists for migration-related support cases.
