Soft Suave
The smart way...

Essvaran S

Full Stack .NET Developer

SUMMARY:

- **5+ years of end-to-end experience** in the full software development life cycle (SDLC), from requirement analysis and architecture design to coding, testing, deployment, and post-production support across diverse client projects.
- **Strong expertise in C# and .NET Core**, with a focus on building scalable, maintainable, and high-performance web applications and microservices.
- Designed and implemented **RESTful Web APIs and microservices**, applying **CQRS pattern** with MediatR for separation of commands and queries, improving maintainability, performance, and scalability of backend services.
- Hands-on experience in **API Gateway integration using Ocelot** to centralize routing, rate limiting, caching, and request aggregation across distributed microservices.
- Built efficient **data access layers** using Entity Framework Core and optimized database interactions with **SQL Server** (stored procedures, indexes, query optimization).
- Practiced **SOLID principles and clean architecture** with Dependency Injection and design patterns such as Repository, Unit of Work, and CQRS.
- Implemented **robust logging and exception handling** using Serilog and middleware pipelines, improving system observability and reliability.
- Integrated **Azure Blob Storage** for secure, scalable document management (upload, download, lifecycle management).
- Integrated distributed caching using Redis to improve application performance, reduce database load, and enhance scalability of frequently accessed data.
- Skilled in **frontend development** with HTML, CSS, JavaScript, and modern frameworks/libraries including **React, Next.js, Bootstrap, Tailwind CSS, and jQuery**, delivering responsive and interactive UIs.
- Experienced in **state management with Redux** in react and **Zustand** in Next.js applications for cleaner and predictable client-side data flow.
- Focused on **application security**, implementing authentication and authorization (JWT, OAuth2), along with encryption strategies to protect sensitive data.
- Proficient with **Git and version control workflows** (branching, pull requests, code reviews) to ensure effective collaboration in team environments.

RESPONSIBILITIES:

- End-to-end development of **full-stack web applications**, working across **frontend (Next.js)** and **backend (.NET Core Web API)**.
- Design and implement **business logic, RESTful APIs, and microservices**, applying **CQRS pattern** for better separation of concerns and scalability.
- Integrate **frontend UIs with backend APIs**, ensuring smooth data flow, responsiveness, and optimized client experiences.
- Implement **role-based and token-based authentication/authorization** using **JWT & OAuth2**, ensuring secure access across environments.
- Enhance application performance by integrating **distributed caching with Redis** and managing API routing/aggregation through **Ocelot API Gateway**.
- Optimize **SQL Server database interactions** with stored procedures, indexing, and Entity Framework Core for efficient data management.
- Implement **asynchronous programming and middleware pipelines** in .NET Core for efficient request handling, logging, and exception management.
- Developed integrations with **Microsoft Graph API** to fetch and manage Azure AD users for role assignments and access management.
- Manage **document storage and retrieval** through **Azure Blob Storage**, ensuring secure and scalable file handling.
- Write and maintain **unit tests, integration tests, and E2E tests** to validate functionality, ensure code reliability, and support CI/CD pipelines.
  Collaborate with cross-functional teams and stakeholders to define scope, gather requirements, and deliver solutions aligned with business goals.
- Create and maintain **technical documentation, architecture diagrams, and workflows** for clarity and future scalability.

TECHNICAL SKILLS:

Frontend: Blazor, Next.js, React, JavaScript, Bootstrap, Telerik UI, Tailwind CSS, jQuery, AJAX, Responsive Web Design

Backend: ASP.NET Core, ASP.NET Web API, ASP.NET MVC, C#, Entity Framework Core, ADO.NET, HTTP Client, RESTful Services, CQRS (MediatR), Ocelot API Gateway, NestJS

Databases: Microsoft SQL Server, PostgreSQL, MongoDB, Cosmos DB

Architecture & Patterns: Monolithic, Microservices, MVC, Layered Architecture, Clean Architecture, OOP, SOLID Principles, Repository Pattern, Unit of Work, CQRS

Testing: xUnit, NUnit, Moq, Integration Testing, E2E Testing with In-Memory Database, Postman Collections

Dev Tools: Visual Studio 2019/2022, VS Code, SQL Server Management Studio (SSMS), pgAdmin, MongoDB Compass, Postman

DevOps & CI/CD: Git, GitHub, Azure DevOps, Docker, Containerization

Cloud/Services: Azure (Blob Storage, AD Authentication, Key Vault), Microsoft Graph API (Azure AD Users & Roles), SFTP

Project Management: Jira, Azure DevOps Boards

Communication Tools: Microsoft Teams, Slack, Skype, Outlook

Operating Systems: Windows 10, Windows 11

RECENT PROFESSIONAL EXPERIENCE:

Project Name: Digital Gateway

Technologies: C#, .NET 8, ASP.NET Core Web API, Entity Framework Core, Azure Cosmos DB, Microsoft Entra ID, Azure Key Vault, Azure Application Insights, Angular 19, TypeScript, Native Federation (Micro Frontend Architecture)

Team Size: 9

Project Management Tool: Azure Devops

Description:

- Digital Gateway is an enterprise web platform designed as a centralized access hub for multiple KPMG applications such as KPMG Clara, Audit News, Thought Leadership, and other internal business applications.
- The platform delivers a personalized and configurable user experience based on user personas and role-based access configured by administrators.
- Administrators can manage layout configurations, application accessibility, and UI arrangements for different personas, while end users can customize widget positioning, resize layouts, and provide feedback on the configured experience.
- The application is built using Micro Frontend (MFE) architecture with Native Federation to enable independent deployment and seamless integration of multiple remote applications within a unified gateway experience.

Responsibilities:

- Contributed as a Full Stack Developer across frontend, backend, cloud integration, and application architecture components.
- Participated in the initial project setup and application scaffolding for both backend services and Angular-based micro frontend modules.
- Gathered business requirements and designed the complete Cosmos DB schema structure for handling persona configurations, layouts, widgets, user preferences, and application mappings.

- Developed reusable repository and data access layers for Cosmos DB with custom query builder implementations to support dynamic and optimized querying capabilities.
- Implemented Single Sign-On (SSO) authentication using MSAL and Microsoft Entra ID for secure access across multiple integrated applications.
- Developed custom session timeout and user inactivity handling mechanisms to improve application security and session management.
- Designed and implemented a centralized event bus service using RxJS to enable communication and state synchronization between multiple micro frontend applications.
- Integrated Azure services including Azure Key Vault and Azure Application Insights for secure configuration management, monitoring, diagnostics, and logging.
- Worked on dynamic role/persona-based UI rendering and access control mechanisms based on administrator configurations.
- Collaborated with cross-functional teams in Agile development cycles using Azure DevOps for sprint planning, task tracking, code reviews, and deployments.

Project Name: EIOS Service Desk

Technologies: .NET 8, Azure Functions, Blazor, Entity Framework Core, Triggers.

Team Size: 2

Project Management Tool: Azure Devops

Description:

- Worked on the EOIS Service Desk application, a cloud-based ticket management system built on Microsoft Azure using C#, ASP.NET Core, Blazor, and Azure Functions.
- The application enables users to create, manage, and track support tickets integrated with Azure DevOps (ADO). Users can raise tickets for themselves or on behalf of other users, with an approval-based workflow for delegated ticket creation.
- It supports ticket lifecycle management, including ticket creation, status updates, comments, notifications, and workflow-driven communication through automated email triggers.
- The solution leverages Azure serverless and event-driven architecture for scalable processing, external integrations, and real-time operations.

Responsibilities:

- Developed and maintained backend processing logic using Azure Functions for handling business workflows, ticket operations, and system integrations
- Built interactive frontend components using Blazor for ticket creation, status tracking, comments, and user interactions
- Implemented serverless and event-driven processing using Azure Functions with multiple trigger types for real-time and scheduled operations
- Integrated the application with Azure DevOps (ADO) for automated ticket creation, tracking, and lifecycle management
- Developed approval-based workflows for on-behalf ticket creation with email acknowledgment and validation process
- Enabled ticket collaboration features including comments, status updates, and automated email notifications to respective users

Project Name: GeoSamplePro

Technologies: .NET 6, SQL Server 7.0, Entity Framework, Azure Blob Storage, Microsoft Graph API, Next 18.2, Zustand, Axios, Tailwind CSS

Team Size: 10

Project Management Tool: Azure Devops

Description:

- GeoSamplePro is a specialized software product developed to manage and preserve geological core samples in the oil and gas industry.
- The platform allows geoscientists and engineers to register, catalog, and retrieve core samples efficiently.
- It streamlines core study processes and ensures secure access through role-based permissions.
- Key features include comprehensive core registration, advanced search and retrieval, and real-time notifications.

Responsibilities:

- Developed RESTful APIs using .NET 6 and Entity Framework to handle container creation, storage, and container allocation.
- Wrote complex stored procedures and SQL queries for core data retrieval and reporting.
- Integrated Microsoft Graph API for handling user information and permissions.
- Implemented secure file storage and retrieval using Azure Blob Storage.
- Performed frontend bug fixes and minor enhancements using React, Zustand, and Tailwind CSS.
- Collaborated with product owners to align software features with domain requirements.
